

GRASS STIMULANT

Terra Tect®

Available exclusively to TERRAPLAS® product owners, TerraTect is a bio stimulant designed to protect grass from the stresses of being covered, and from extremes in temperature and humidity.

Natural and hybrid grass can be treated prior to covering with a TERRAPLAS® protection system. The application of TerraTect can be combined with other maintenance products, such as anti-fungal and growth retardant, for maximum effect.

TerraTect is an entirely organic solution, free from any chemical components or toxic elements. This ensures that there are no adverse effects associated with any grass variety and/or climate combination.

The perfect, natural solution to extend the period that quality grass can be covered for special events.

Extend the period the turf can be covered without damage and reduce the recovery period after lifting with terratect application.

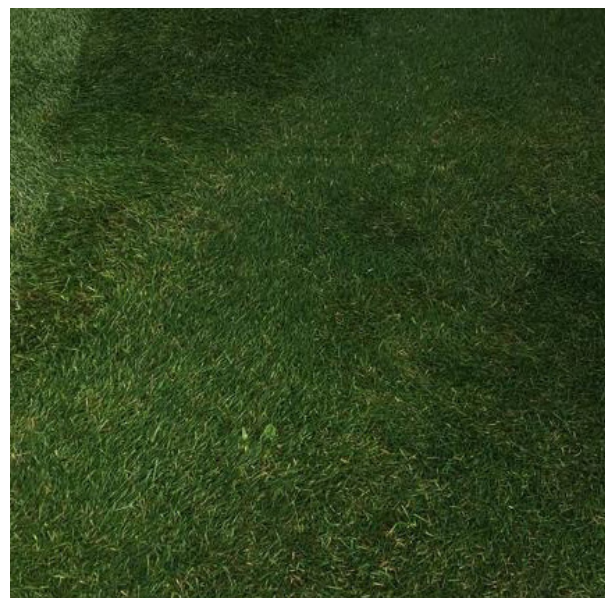

TerraTect contains a flavonoid that acts as an elicitor when mixed with other products, pulling all the product molecules tighter together. As a result it takes longer to break them down, extending their longevity and effectiveness.

- The blend of L-amino acid and salicylic acid is derived from natural compounds found in stress-resistant plants
- TerraTect triggers the activation of the plant's defense mechanisms through a systemic acquired resistance (SAR) response
- Successfully trialled in combination with National Stadium and Premier League Club natural turf protection

TerraTrakPlus tiles removed on grass pre-treated with TerraTect.
